My Projects

Oct 13, 2026 · @faizanch

Items in [brackets] are placeholders to confirm or replace.

1. AI-Driven Auction App (Final Year Project)

What it does: A mobile auction platform where users can list items, place bids, and follow auctions in real time. AI features [such as price prediction for listed items, recommendations, or fraud detection] help buyers and sellers make better decisions.

Tech used: Flutter for the mobile app, Python for the AI models and backend, [Firebase / FastAPI / Flask, database name].

My role: This was my Final Year Project at IUIC. I [built the Flutter app and the AI module / led the team of X members].

Result: Completed and presented as my FYP, [grade or outcome]. It taught me how to combine mobile development with machine learning in one product.

2. Multilingual RAG System (English, German, Urdu)

What it does: A Retrieval-Augmented Generation system that answers questions from a collection of documents in English, German, and Urdu, with citations pointing to the source.

Tech used: Python, FastAPI, FAISS, BM25 hybrid search, cross-encoder reranking, Hugging Face embedding models, Groq LLM API, React.

My role: I built the full pipeline myself: document ingestion with OCR and language detection, chunking, hybrid search, reranking, answer generation, and a security layer against prompt injection.

Result: A working end-to-end system that handles questions across three languages and returns cited answers.

3. E-Scooter Website

What it does: A website for an e-scooter [rental / sales] business where users can browse scooters, view details and prices, and [book or contact the business].

Tech used: React, [CSS / Tailwind].

My role: I designed and built the frontend.

Result: A responsive, modern website that works on desktop and mobile.

4. Chat Application

What it does: A real-time chat app where users can sign up, find others, and exchange messages instantly.

Tech used: React, [Node.js, Express, MongoDB, Socket.io / Firebase].

My role: I built [the full stack / the frontend and real-time messaging].

Result: Messages are delivered instantly between users, and the project gave me hands-on experience with real-time communication.

5. Video Calling App

What it does: A mobile app for one-to-one [and group] video calls.

Tech used: Flutter, [Agora / WebRTC / ZegoCloud], [Firebase].

My role: I built the app, including the call interface and the video calling integration.

Result: A working app with smooth video and audio calls.

6. Expense Tracker

What it does: A mobile app for recording daily expenses, sorting them into categories, and viewing spending summaries [with charts].

Tech used: Flutter, [SQLite / Hive / Firebase].

My role: I designed and built the entire app.

Result: A simple tool that makes it easy to see where money goes each month.

7. Weather App

What it does: Shows current weather and forecasts for any city, including temperature, humidity, and conditions.

Tech used: Flutter, [OpenWeatherMap API].

My role: I built the app and integrated the live weather API.

Result: A clean app showing real-time weather data, which helped me learn how to work with REST APIs in Flutter.

8. To-Do App

What it does: Lets users add, edit, complete, and delete tasks to stay organized.

Tech used: Flutter, [local storage such as Hive / SQLite].

My role: I built the entire app.

Result: A lightweight productivity app that saves tasks on the device.

9. Jarvis (Python Voice Assistant)

What it does: A desktop voice assistant inspired by Jarvis that listens to voice commands and performs tasks like [opening websites and apps, searching Wikipedia, telling the time, playing music].

Tech used: Python, [SpeechRecognition, pyttsx3, Wikipedia API].

My role: I built it as a personal project.

Result: A working assistant that responds to spoken commands, and one of the first projects that sparked my interest in AI.
